New Service Offering

BIDMC NICU Now Able to Offer Expanded Point of Care Ultrasound

With the addition of a new curvilinear ultrasound probe, neonatologists will now be able to identify the tip of UVC lines using point of care ultrasound. This probe also will allow physicians to obtain a quick view of the heart and could be useful in emergent situations (i.e. concern for pericardial effusion).

The purchase of the new probe was made possible through directed philanthropic support.
